Player Retention Overview

Rolling retention performance and registration cohort trends

D1+ Rolling Retention
23.87%

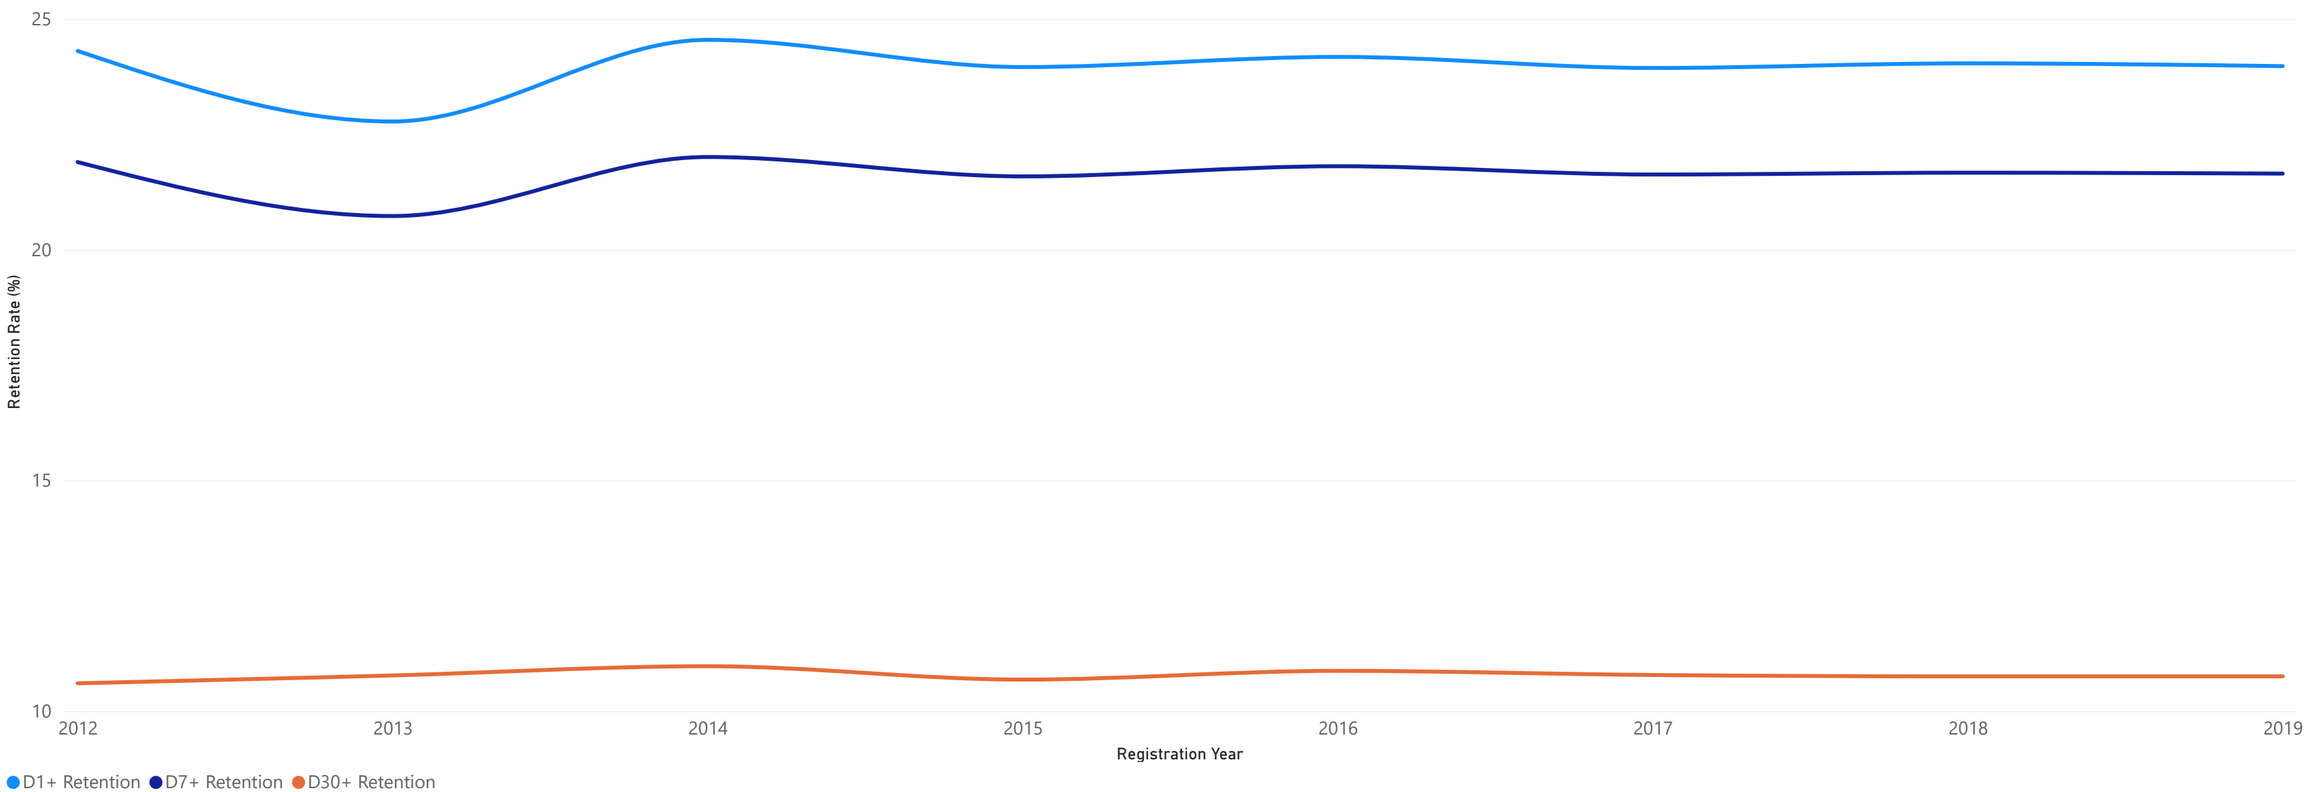

D7+ Rolling Retention
21.57%

D30+ Rolling Retention
10.72%

Key Insight

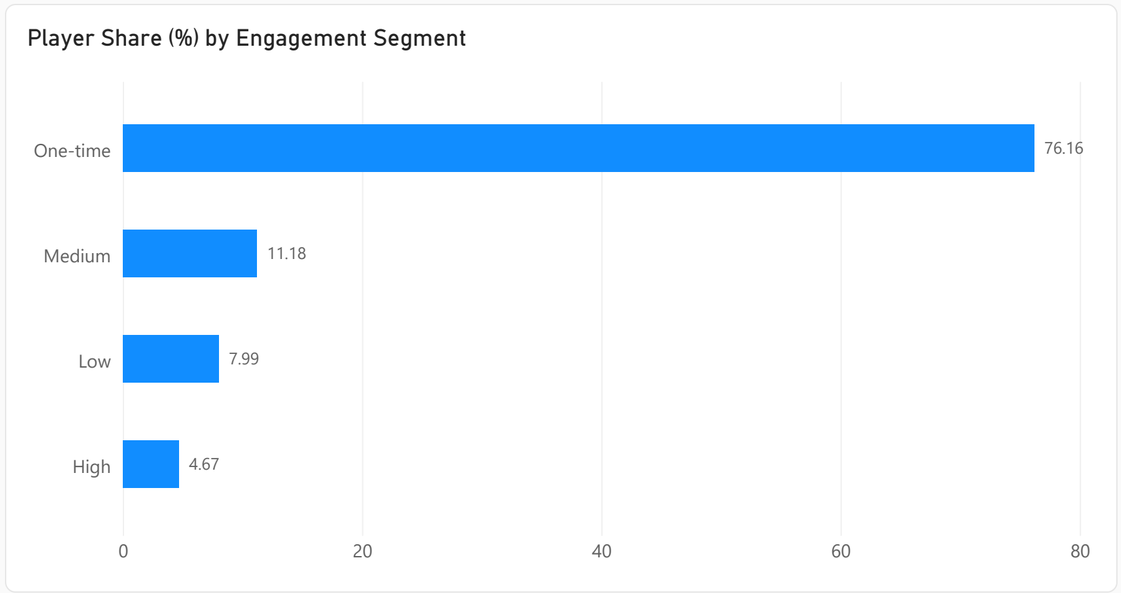

Rolling retention remains relatively stable across registration cohorts, while D30+ retention stays around 11%. This suggests that the long-term retention challenge is persistent rather than isolated to a specific cohort.

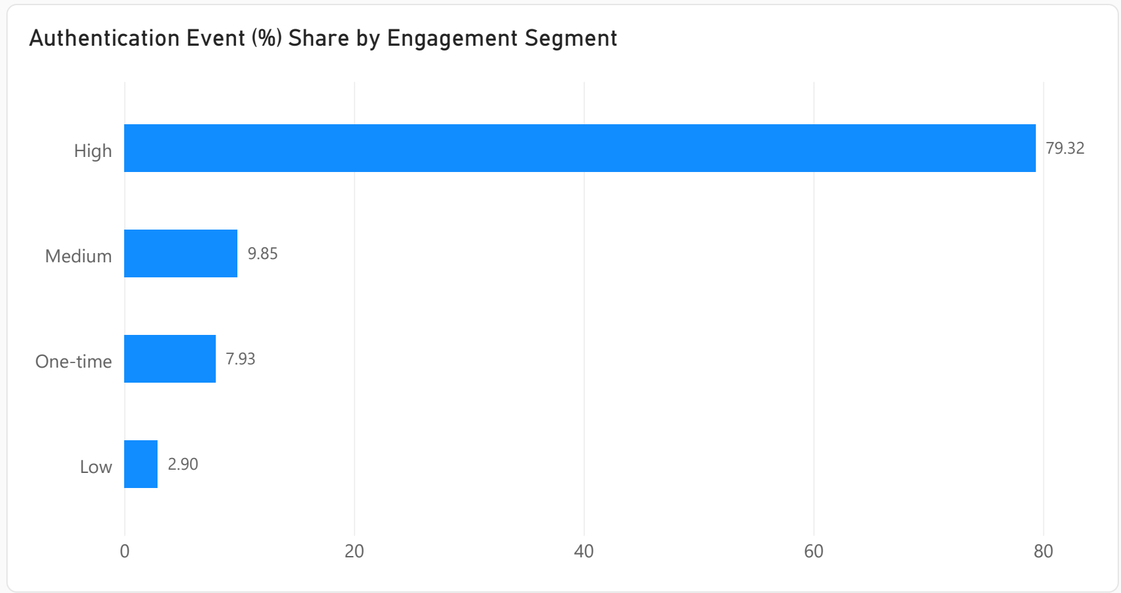

Rolling Retention by Registration Cohort

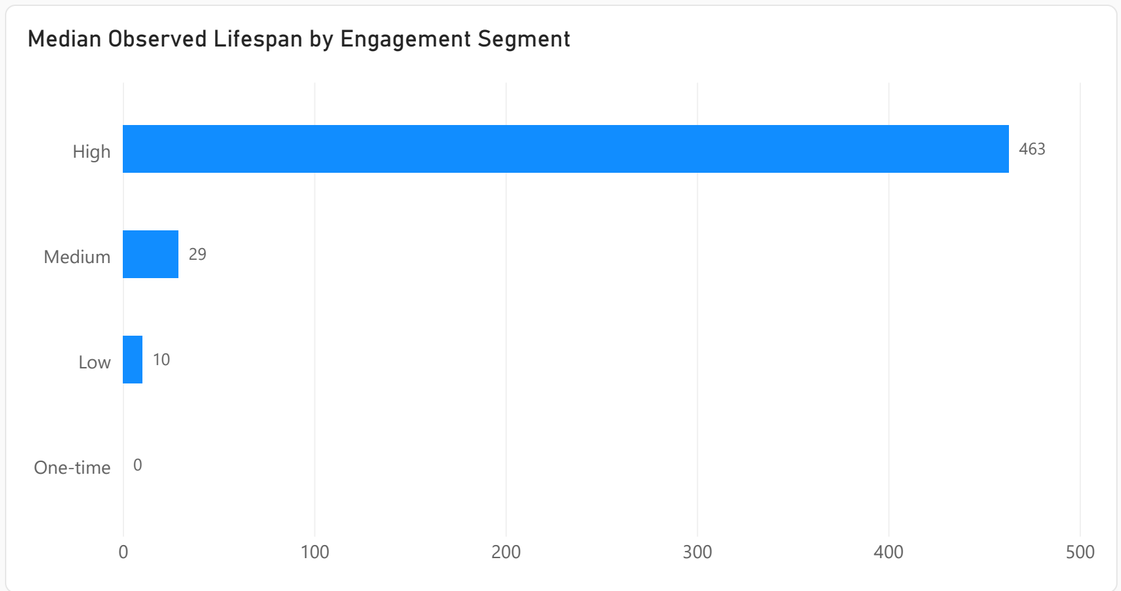

Player Engagement Analysis

Distribution of players, authentication activity and observed lifespan across engagement segments

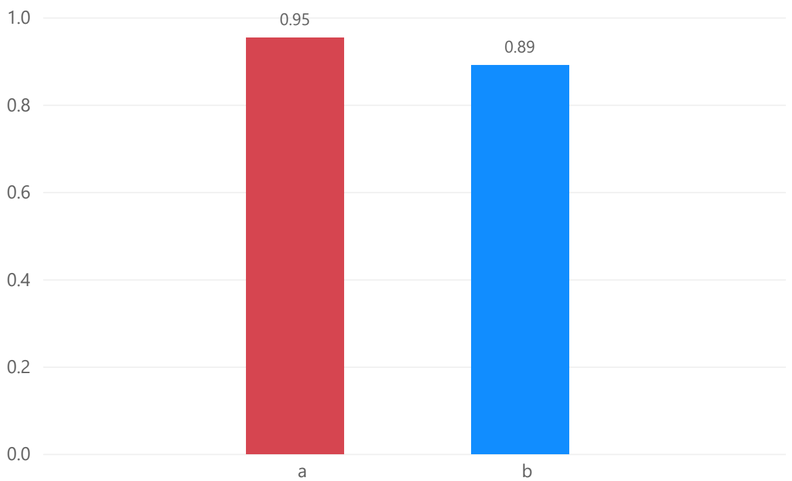

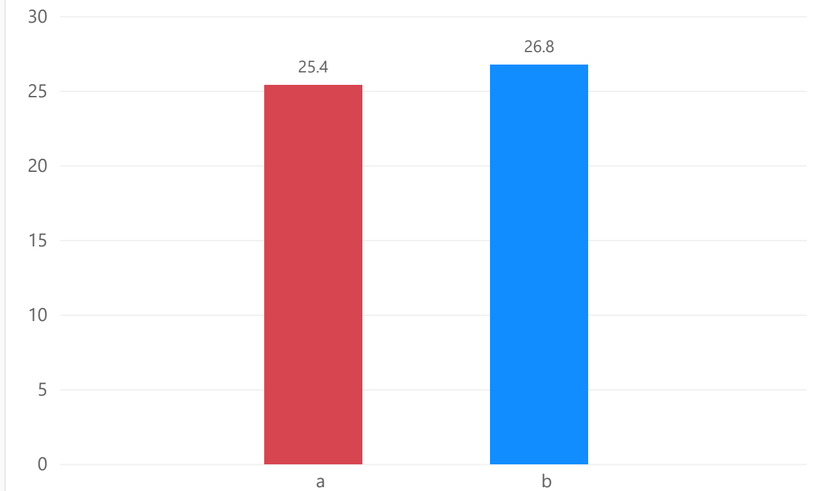

Key Insight

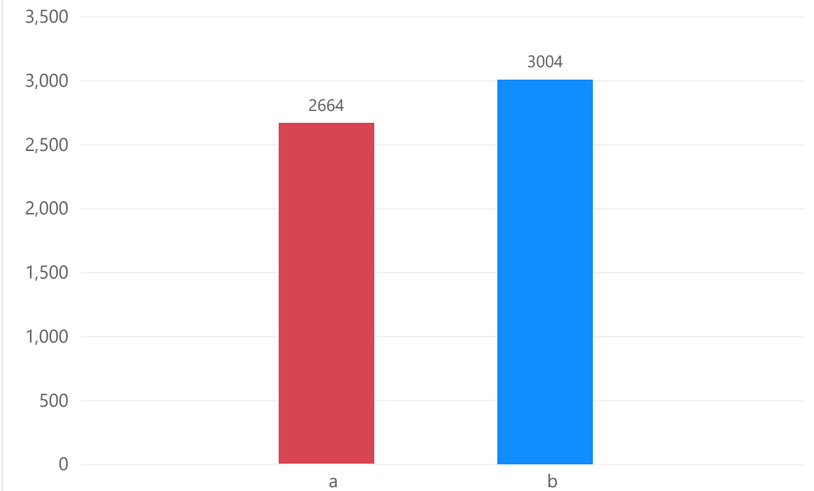

Authentication activity is highly concentrated: High-engagement players represent only 4.67% of players but account for 79.32% of authentication events. Their median observed lifespan reaches 463 days, compared with 29 days for Medium-engagement players.

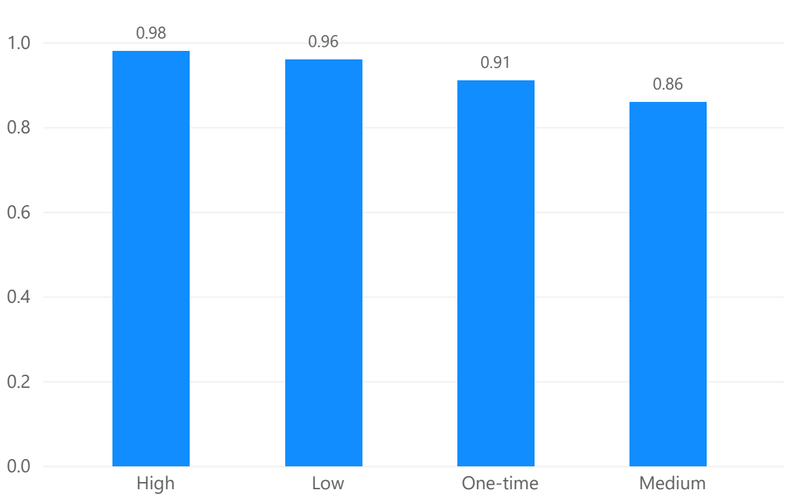

Monetization & A/B Test Analysis

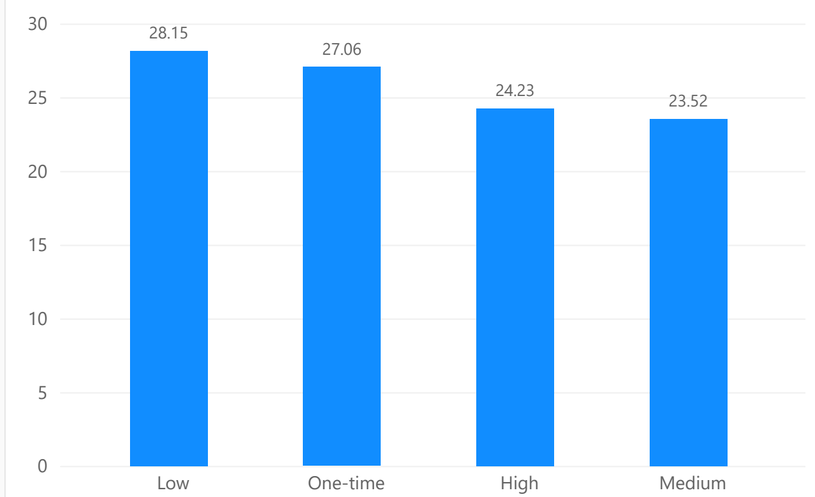

Comparison of payer conversion, revenue performance and monetization across player segments

Key Insight

Group A achieved a higher payer conversion than Group B (0.954% vs. 0.891%), with the difference statistically significant ($z \approx 2.11$, $p \approx 0.035$). However, Group B generated higher ARPU and ARPPU. Engagement also shows no clear linear relationship with monetization, suggesting that higher authentication activity does not necessarily translate into higher revenue per user.
